

# BIRD RE-NESTING

You can create a makeshift nest for a cup-nesting songbird by using a basket and shredded paper.

- Hang as close to original nest as possible.
- Monitor 2-4 hours to see if parents have returned.
- If no fresh feces is present, bring baby to your local wildlife hospital.

For cavity dwellers like woodpeckers, a jug or hollow container can be used.

- Cut a hole in the front of the jug and poke drain holes in the bottom.
- Line jug with leaves, twigs, grass, or shredded paper.
- Affix jug securely to a solid structure near cavity entrance outside of direct sunlight.
- Observe from a distance for 2-4 hours to see if parents return.
- If not, transport to wildlife hospital.

If you need help determining the species for re-nesting, contact your local wildlife hospital.
